ethical ad by CodeFund

Heroku is a web hosting platform supporting many languages, and this guide is a reference to Heroku's [command-line interface](#).

create - Create an app

```
heroku create sushi
```

```
git push heroku master
```

access - Collaboration

Manage collaborators

```
heroku access # List
heroku access:add me@xy.com
heroku access:remove me@xy.com
```

Transfer to another owner

```
heroku apps:transfer new@owner.com
```

logs - Show logs

```
heroku logs
heroku logs -t # --tail (stream)
heroku logs -s app # --source (only on app logs)
```

releases

```
heroku releases
heroku releases:info v25
heroku rollback
```

pg - PostgreSQL

Start a database

```
heroku addons:add heroku-postgresql
```

Enable backups

```
heroku addons:add pgbackups:auto-month
```

See: [Heroku PostgreSQL](https://devcenter.heroku.com/articles/postgresql) (devcenter.heroku.com)

config - Environment var configuration

Listing

```
heroku config      # List
heroku config -s   # List in shell format
```

Getting

```
heroku config:get KEY
```

Setting

```
heroku config:set KEY=val
heroku config:set KEY1=val KEY2=val ...
```

```
heroku config:unset KEY1
```

apps - Applications

```
heroku apps          # list
heroku apps:create [NAME]
heroku apps:destroy --app APP
heroku apps:info
heroku apps:open      # open in browser
heroku apps:rename NEWNAME
```

maintenance

```
heroku maintenance:on
```

```
heroku maintenance:off
```

Processes

ps - Managing processes

```
heroku ps          # list
heroku ps:scale web=1 # spawn more dynos
```

restart

```
heroku restart
```

run - Running tasks

```
heroku run bash
heroku run console # Rails console
heroku run rake assets:precompile
```

Domains

domains - Custom domains

Add both!

```
heroku domains:add example.com
heroku domains:add www.example.com
```

Removing

```
heroku domains:clear
heroku domains:remove example.com
```

See: [Custom domains](https://devcenter.heroku.com/articles/custom-domains) (devcenter.heroku.com)

Wildcard domains

```
heroku addons:add wildcard_domains
```

```
*.yourdomain.com => heroku.com
```

Other tricks

htpasswd (for PHP apps)

Create an `.htaccess` file in the webroot:

```
AuthUserFile /app/www/.htpasswd
AuthType Basic
AuthName "Restricted Access"
Require valid-user
```

Create a `.htpasswd` file:

```
$ htpasswd -c .htpasswd [username]
```

See: gist.github.com
