

# Cheat Sheet

## Bootstrapping

```
import { platformBrowserDynamic }  
from '@angular/platform-browser-  
dynamic';
```

```
platformBrowserDynamic().bootstrapModule
```

Bootstraps the app, using the root component from the specified `NgModule`.

# NgModules

```
import { NgModule } from  
  
'@angular/core';
```

```
@NgModule({ declarations: ...,  
  
imports: ...,  
  
exports: ..., providers: ...,  
  
bootstrap: ...})  
  
class MyModule {}
```

Defines a module that contains components, directives, pipes, and providers.

```
declarations: [MyRedComponent,  
  
MyBlueComponent, MyDatePipe]
```

List of components, directives, and pipes that belong to this module.

```
imports: [BrowserModule,  
  
SomeOtherModule]
```

List of modules to import into this module. Everything from the imported modules is available to `declarations` of this module.

```
exports: [MyRedComponent,  
  
MyDatePipe]
```

List of components, directives, and pipes visible to modules that import this module.

```
providers: [MyService, { provide:  
... }]
```

List of dependency injection providers visible both to the contents of this module and to importers of this module.

```
entryComponents: [SomeComponent,  
OtherComponent]
```

List of components not referenced in any reachable template, for example dynamically created from code.

```
bootstrap: [MyAppComponent]
```

List of components to bootstrap when this module is bootstrapped.

## Template syntax

```
<input [value]="firstName">
```

Binds property `value` to the result of expression `firstName`.

```
<div [attr.role]="myAriaRole">
```

Binds attribute `role` to the result of expression `myAriaRole`.

```
<div [class.extra-sparkle]="isDelightful">
```

Binds the presence of the CSS class `extra-sparkle` on the element to the truthiness of the expression `isDelightful`.

```
<div [style.width.px]="mySize">
```

Binds style property `width` to the result of expression `mySize` in pixels. Units are optional.

```
<button(click)="readRainbow($event)">
```

Calls method `readRainbow` when a click event is triggered on this button element (or its children) and passes in the event object.

```
<div title="Hello {{ponyName}}">
```

Binds a property to an interpolated string, for example, "Hello Seabiscuit". Equivalent to: `<div`

```
[title]='Hello ' + ponyName">
```

```
<p>Hello {{ponyName}}</p>
```

Binds text content to an interpolated string, for example, "Hello Seabiscuit".

```
<my-cmp [(title)]="name">
```

Sets up two-way data binding. Equivalent to: `<my-cmp`

```
[title]="name"
```

```
(titleChange)="name=$event">
```

```
<video #movieplayer ...>
```

```
<button (click)="movieplayer.play()">
```

```
</video>
```

Creates a local variable `movieplayer` that provides access to the `video` element instance in data-binding and event-binding expressions in the current template.

```
<p *myUnless="myExpression">...</p>
```

The `*` symbol turns the current element into an embedded template.

Equivalent to: 

```
<ng-template  
[myUnless]="myExpression"><p>...</p>  
</ng-template>
```

```
<p>Card No.: {{cardNumber |  
myCardNumberFormatter}}</p>
```

Transforms the current value of expression `cardNumber` via the pipe called `myCardNumberFormatter`.

```
<p>Employer:  
{{employer?.companyName}}</p>
```

The safe navigation operator (`?`) means that the `employer` field is optional and if `undefined`, the rest of the expression should be ignored.

```
<svg:rect x="0" y="0" width="100"  
height="100"/>
```

An SVG snippet template needs an `svg:` prefix on its root element to disambiguate the SVG element from an HTML component.

```
<svg>
```

```
<rect x="0" y="0" width="100"
```

```
height="100"/>
```

```
</svg>
```

An `<svg>` root element is detected as an SVG element automatically, without the prefix.

## Built-in directives

```
import { CommonModule } from  
  
'@angular/common';
```

```
<section *ngIf="showSection">
```

Removes or recreates a portion of the DOM tree based on the `showSection` expression.

```
<li *ngFor="let item of list">
```

Turns the li element and its contents into a template, and uses that to instantiate a view for each item in list.

```
<div[ngSwitch]="conditionExpression">  
  
<ng-  
  
template[ngSwitchCase]="case1Exp">...  
</ng-template>  
  
<ng-  
  
templatengSwitchCase="case2LiteralStrin  
</ng-template>  
  
<ng-template ngSwitchDefault>...  
</ng-template>  
  
</div>
```

Conditionally swaps the contents of the div by selecting one of the embedded templates based on the current value of `conditionExpression`.

```
<div [ngClass]="{'active': isActive,  
'disabled': isDisabled}">
```

Binds the presence of CSS classes on the element to the truthiness of the associated map values. The right-hand expression should return {class-name: true/false} map.

```
<div [ngStyle]="{'property':  
'value'}">
```

```
<div [ngStyle]="dynamicStyles()">
```

Allows you to assign styles to an HTML element using CSS. You can use CSS directly, as in the first example, or you can call a method from the component.

## Forms

```
import { FormsModule } from  
'@angular/forms';
```

```
<input [(ngModel)]="userName">
```

Provides two-way data-binding, parsing, and validation for form controls.

## Class decorators

```
import { Directive, ... } from  
'@angular/core';
```

```
@Component({...})
```

```
class MyComponent() {}
```

Declares that a class is a component and provides metadata about the component.

```
@Directive({...})
```

```
class MyDirective() {}
```

Declares that a class is a directive and provides metadata about the directive.

```
@Pipe({...})
```

```
class MyPipe() {}
```

Declares that a class is a pipe and provides metadata about the pipe.

```
@Injectable()
```

```
class MyService() {}
```

Declares that a class can be provided and injected by other classes. Without this decorator, the compiler won't generate enough metadata to allow the class to be created properly when it's injected somewhere.

## Directive configuration

```
@Directive({ property1: value1, ...  
})
```

```
selector: '.cool-button:not(a)'
```

Specifies a CSS selector that identifies this directive within a template.

Supported selectors include `element`, `[attribute]`, `.class`, and `:not()`.

Does not support parent-child relationship selectors.

```
providers: [MyService, { provide:  
... }]
```

List of dependency injection providers for this directive and its children.

## Component configuration

`@Component` extends `@Directive`, so the `@Directive` configuration applies to components as well

`moduleId: module.id`

If set, the `templateUrl` and `styleUrl` are resolved relative to the component.

`viewProviders: [MyService, {  
provide: ... }]`

List of dependency injection providers scoped to this component's view.

`template: 'Hello {{name}}'`  
`templateUrl: 'my-component.html'`

Inline template or external template URL of the component's view.

`styles: ['.primary {color: red}']`  
`styleUrls: ['my-component.css']`

List of inline CSS styles or external stylesheet URLs for styling the component's view.

## Class field decorators for directives and components

```
import { Input, ... } from  
'@angular/core';
```

```
@Input() myProperty;
```

Declares an input property that you can update via property binding (example: `<my-cmp [myProperty]="someExpression">`).

```
@Output() myEvent =  
new EventEmitter();
```

Declares an output property that fires events that you can subscribe to with an event binding (example: `<my-cmp (myEvent)="doSomething()">`).

```
@HostBinding('class.valid') isValid;
```

Binds a host element property (here, the CSS class `valid`) to a directive/component property (`isValid`).

```
@HostListener('click',  
 ['$event'])onClick(e) {...}
```

Subscribes to a host element event (`click`) with a directive/component method (`onClick`), optionally passing an argument (`$event`).

```
@ContentChild(myPredicate)myChildCompon
```

Binds the first result of the component content query (`myPredicate`) to a property (`myChildComponent`) of the class.

```
@ContentChildren(myPredicate)myChildCor
```

Binds the results of the component content query (`myPredicate`) to a property (`myChildComponents`) of the class.

```
@ViewChild(myPredicate)myChildComponent
```

Binds the first result of the component view query (`myPredicate`) to a property (`myChildComponent`) of the class.  
Not available for directives.

`@ViewChildren(myPredicate)myChildCompon`

Binds the results of the component view query (`myPredicate`) to a property (`myChildComponents`) of the class. Not available for directives.

## Directive and component change detection and lifecycle hooks

(implemented as class methods)

```
constructor(myService: MyService,  
...) { ... }
```

Called before any other lifecycle hook. Use it to inject dependencies, but avoid any serious work here.

```
ngOnChanges(changeRecord) { ... }
```

Called after every change to input properties and before processing content or child views.

```
ngOnInit() { ... }
```

Called after the constructor, initializing input properties, and the first call to `ngOnChanges`.

```
ngDoCheck() { ... }
```

Called every time that the input properties of a component or a directive are checked. Use it to extend change detection by performing a custom check.

```
ngAfterContentInit() { ... }
```

Called after `ngOnInit` when the component's or directive's content has been initialized.

```
ngAfterContentChecked() { ... }
```

Called after every check of the component's or directive's content.

```
ngAfterViewInit() { ... }
```

Called after `ngAfterContentInit` when the component's views and child views / the view that a directive is in has been initialized.

```
ngAfterViewChecked() { ... }
```

Called after every check of the component's views and child views / the view that a directive is in.

```
ngOnDestroy() { ... }
```

Called once, before the instance is destroyed.

## Dependency injection configuration

```
{ provide: MyService, useClass: MyMockService }
```

Sets or overrides the provider for `MyService` to the `MyMockService` class.

```
{ provide: MyService, useFactory: myFactory }
```

Sets or overrides the provider for `MyService` to the `myFactory` factory function.

```
{ provide: MyValue, useValue: 41 }
```

Sets or overrides the provider for `MyValue` to the value `41`.

## Routing and navigation

```
import { Routes, RouterModule, ... }  
  
from '@angular/router';
```

```
const routes: Routes = [  
  
  { path: '', component: HomeComponent  
  },  
  
  { path: 'path/:routeParam',  
    component: MyComponent },  
  
  { path: 'staticPath', component: ...  
  },  
  
  { path: '**', component: ... },  
  
  { path: 'oldPath', redirectTo:  
    '/staticPath' },  
  
  { path: ..., component: ..., data: {  
    message: 'Custom' } }  
  ],  
  
  const routing =  
  
  RouterModule.forRoot(routes);
```

Configures routes for the application. Supports static, parameterized, redirect, and wildcard routes. Also supports custom route data and resolve.

```
|  
  
<router-outlet></router-outlet>  
  
<router-outlet name="aux"></router-  
  
outlet>
```

Marks the location to load the component of the active route.

```
<a routerLink="/path">  
  
<a [routerLink]="[ '/path',  
routeParam ]">  
  
<a [routerLink]="[ '/path', {  
matrixParam: 'value' } ]">  
  
<a [routerLink]="[ '/path' ]"  
[queryParams]="{ page: 1 }">  
  
<a [routerLink]="[ '/path' ]"  
fragment="anchor">
```

Creates a link to a different view based on a route instruction consisting of a route path, required and optional parameters, query parameters, and a fragment. To navigate to a root route, use the `/` prefix; for a child route, use the `./` prefix; for a sibling or parent, use the `../` prefix.

```
<a [routerLink]="[ '/path'  
]"routerLinkActive="active">
```

The provided classes are added to the element when the `routerLink` becomes the current active route.

```
class CanActivateGuard
implements CanActivate {
  canActivate(
    route: ActivatedRouteSnapshot,
    state: RouterStateSnapshot
  ):
    Observable<boolean|UrlTree>|Promise<boo
    { ... }
  }

  { path: ..., canActivate:
    [CanActivateGuard] }
```

An interface for defining a class that the router should call first to determine if it should activate this component. Should return a boolean|UrlTree or an Observable/Promise that resolves to a boolean|UrlTree.

```
class CanDeactivateGuard
implements CanDeactivate<T> {
    canDeactivate(
        component: T,
        route: ActivatedRouteSnapshot,
        state: RouterStateSnapshot
    ):
    Observable<boolean|UrlTree>|Promise<boo
    { ... }
}

{ path: ..., canDeactivate:
  [CanDeactivateGuard] }
```

An interface for defining a class that the router should call first to determine if it should deactivate this component after a navigation. Should return a boolean|UrlTree or an Observable/Promise that resolves to a boolean|UrlTree.

```

class CanActivateChildGuard
implements CanActivateChild {
  canActivateChild(
    route: ActivatedRouteSnapshot,
    state: RouterStateSnapshot
  ):
    Observable<boolean|UrlTree>|Promise<boo
{ ... }
}

{ path: ..., canActivateChild:
  [CanActivateGuard],
  children: ... }

```

An interface for defining a class that the router should call first to determine if it should activate the child route. Should return a boolean|UrlTree or an Observable/Promise that resolves to a boolean|UrlTree.

```

class ResolveGuard
implements Resolve<T> {
  resolve(
    route: ActivatedRouteSnapshot,
    state: RouterStateSnapshot
  ): Observable<any>|Promise<any>|any
{ ... }
}

{ path: ..., resolve: [ResolveGuard]
}

```

An interface for defining a class that the router should call first to resolve route data before rendering the route. Should return a value or an Observable/Promise that resolves to a value.

```
class CanLoadGuard
implements CanLoad{
canLoad(
route: Route
):
Observable<boolean|UrlTree>|Promise<boo
{ ... }
}

{ path: ..., canLoad:
[CanLoadGuard], loadChildren: ... }
```

An interface for defining a class that the router should call first to check if the lazy loaded module should be loaded. Should return a boolean|UrlTree or an Observable/Promise that resolves to a boolean|UrlTree.
